

## Problem:

Build an inventory management system.

Figure out what you're going to sell

Build an inventory

Find information on what you are selling

Product display (brand name, distillery, location, price, sku, id)

## Planning:

~~Build wireframe~~

~~Figure out what you're going to sell~~

~~Opening page — state store name, and enter link for age verification~~

~~Products page — Find information on what you are selling~~

~~Cart page — add to cart function, PayPal (bonus), total, remove~~

~~Search bar & display page~~

~~Build an inventory~~

~~———— JSON file to store array of items for implementation (brand name, distillery, location, price, sku, id).~~

\*\*\*look into Bootstrap and/or other extensions

## Execute Plan:

Products and product display completed with little confusion.

JSON data loads as expected

Attended video call to see where I was creating errors with add to cart

Reflections:

- Search Bar and display
- FLEX BOX, FLEX BOX, FLEX BOX
- Refactor cart display with billing, remove, total, subtotal, tax
- Do not rewrite over code, recreate the application
- Keep pushing
